                                                                                                                                                                                                                                 Antibodies which recognise specific subfragments of the beta-amyloid protein are claimed. Specifically, the antibodies (which are pref. monoclonal) recognise residues 1-16 and/or 1-28 from the N-terminal portion of beta-amyloid or they recognise residues 25-35 or 35-43 from the C-terminal portion. The antibodies are useful for assaying beta-amyloid and its derivatives for diagnosis of Alzheimer's
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Amyloid precursor protein; APP; Alzheimer's disease; anti-beta-amyloid antibody; diagnosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The peptide is an internal fragment of the beta amyloid peptide precursor, which was produced synthetically. The peptide, when labelled, may be used in in vitro methods for the detection of Alzheimer's disease. See also AAR33192.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Antibodies recognising specific parts of beta-amyloid - can be used for diagnosis of diseases implicating beta-amyloid, such as
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        04-AUG-1994

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Amyloid
amyloid
                                                                                                                                                                                                                                                                                                                                                                                           precursor protein (sAPP). The method uses an antibody against amyloid beta-protein (A beta; produced from sAPP) or sAPP. The present sequence represents amino acids 1 to 40 of amyloid beta-protein. SAPP can be assayed accurately, and when including a monoclonal antibody recognising the N-terminus of A beta and a monoclonal antibody recognising sAPP, the assay can be used to diagnose Alzheimer's disease. Senfor plaque observed in the brain of Alzheimer's patients is primarily composed of
                                                                                                                                                                                            A beta , which is generated from sAPP. Simple and accurate assay of sAPP is possible. The antibody (preferably monoclonal) preferably has an antigen recognition site which is an amino acid sequence common to A beta and sAPP, or specific to sAPP. The sAPP assayed for preferably has part of the A beta sequence at its amino terminus and is preferably solubilised through cleavage of the A beta between positions 16 (lysine) and 17 (leucine) from the amino acid terminus. The preferred method
                                                                            comprises immobilising one antibody (especially generated by (2)) on an insoluble carrier, capturing a substance to be assayed on to this antibody, reacting another, labelling, antibody with the assay substand detecting the activity of the labelling substance bound to the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Assay for soluble amyloid precursor protein useful to diagnose Alzheimer's disease - uses antibodies against amyloid beta-protein, also new hybridoma producing antibodies

                                                                                                                                                                                                                                                                                      a receptor for advanced glycosylation end product and a carrier. A method for inhibiting interaction of amyloid beta peptide with a receptor for advanced glycosylation on the surface of a cell comprises contacting the cell with e.g. present peptide. Depending on the type of cell, inhibiting the interaction between the amyloid beta peptide and the receptor for advanced glycosylation can be used for inhibiting degeneration of a neuronal cell, inhibiting formation of an amyloid beta peptide into a cell, inhibiting extracellular assembly of amyloid beta peptide into a fibril, inhibiting aggregation of amyloid beta peptide on the surface of a cell, inhibiting infiltration of a microylial peptide on the surface of a cell, inhibiting infiltration of a microylial
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     is the principal component of extracellular deposits in Alzheimer's disease. It has been shown to promote nuerite outgrowth, generate reactive oxygen intermediates, induce cellular oxidant stress, lead to neuronal cytotoxcity, and promote microglial activation. The present peptide, which comprises amino acids 1-40 of the amyloid beta peptide, is used in a pharmaceutical composition. This composition comprises an agent capable of inhibiting interaction of an amyloid beta peptide with
                                                                                                                                                                                       cell into senile plaques, and inhibiting activation of microglial cells by amyloid beta peptide. The methods can be used for treating e.g. diabetes, Alzheimer's Disease, senility, renal failure, hyperlipidemic atherosclerosis, neuronal cytotoxicity, Down's syndrome, dementia associated with head trauma, amyotrophic lateral sclerosis, multiple
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Amyloid beta peptide; extracellular deposit; Alzheimer's disease; nuerite outgrowth; microglial activation; neuronal cell degeneration; receptor for advanced glycosylation end product; amyloid beta peptide fibril.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Peptides AAW23335-36 are portions of the the amyloid beta peptide, which is the principal component of extracellular deposits in Alzheimer's
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Claim 4;

The method comprises contacting a silk sample with labelled BAP, optionally in the presence of a test agent, detecting the amount of label bound to the silk and assessing the effect of the agent on the deposition of BAP. Agents that inhibit binding of BAP to silk are potentially useful for treating amyloidosis diseases, especially Alzheimer's disease.

The invention relates to methods for the formation of congophilic maltese-cross spherical amyloid plaques, which are characteristic of Alzheimer's disease. The amyloid plaques are formed by co-incubation of this beta-amyloid protein with sulphated macromolecules. The methods come be used to study the formation of amyloid plaques and to identify anti-plaque therapeutics. They can be used for diseases such as Alzheimer's disease, Cretzfeldt-Jakob disease, Gerstmann-Straussler
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Formation of amyloid plaques using amyloid protein and sulphated macromolecules, for, e.g. identification of agents for treating Alzheimer's disease \,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 WPI;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          This invention describes a novel method for the determination of the degree of aggregation of an amyloid beta A4 peptide (I) in solution. Determination comprises: (a) incubating a sample of unaggregated (I) with Coomassie Brilliant Blue G 250 dye (II) which only binds to unaggregated (I); (b) measuring the amount of (II) bound to (I) to obtain a value (i); (c) repeating steps (a) and (b) with a second sample at a different time to obtain a second value (ii); and (d) determining the difference between (i) and (ii) which is inversely related to the degree of aggregation of (I). This method may be applied to a screen for compounds that inhibit aggregation of (I). These inhibitors may be used as therapeutic drugs to inhibit the
This sequence represents a fragment of the human beta-amyloid protein, and can be used in the method of the invention. The method is for inducing amyloid plaque deposition in a mammal by infusing into the brain an amyloid peptide (I) at a basic pH. Animals in which amyloid plaque deposition has been induced are models of human Alzheimer's disease (AD) and are used to screen for agents (A) that inhibit: (a) deposition of amyloid plaque; and (b) AD-associated disruptions to sleep and circadian activity. They may also be used to study the etiology of AD. Compared
                                                                                                                                                                                                                                        Claim

                                                                                                          This sequence corresponds to an aggregating amyloid-beta peptide which can be covalently labelled with a fluorescent group. The detection or monitoring of an amyloid aggregate in a sample can be used to diagnose or detect a predisposition to Alzheimer's disease. The screening assays can be used to identify compounds for the treatment or amelioration of Alzheimer's disease or its symptoms. The fluorescent derivatives of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   any, plaques and does not stimulate an immune response. Most (I)-treated animals develop AD-type pathology (contrast transgenic models of the disease), including sleep and circadian rhythm disturbances.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      with known methods for inducing plaque deposition, this process causes less mechanical damage; the vehicle used is less neurocoxic and at basipH (I) is soluble enough for delivery by continuous infusion with effective delivery to brain tissue.                                                                                                                                                                                                                                                                                                             a neurotoxin. The method involves incubating tachykinin agonists with neuronal cells and a beta-amyloid peptide neurotoxin. The methods can be used for identifying compounds for treating diseases characterised by an undesirable build up of beta-amyloid protein, e.g. Alzheimer's disease, Down's syndrome, and the syndromes of hereditary cerebral haemorrhage with amyloidosis and non-inherited congophilic angiopathy with cerebral haemorrhage. AAM92655-W92731 are tachykinin agonists derived from human

                                                                                                                        sequences AAW81466 to AAW81476 represent synthetic amyloid beta (Abeta) peptides. The invention provides a process for treating a synthetic Abeta peptide that comprises dissolving the peptide in a deoxygenated solvent selected from trifluoroethanol, hexafluorocyclohexane, dimethyl sulphoxide, morpholinopropanesulphonic acid, dimethylformamide and acetonitrile to a concentration of 0.01-10 mg/ml, incubating the solution at 20-65 deg. C for 0.5-4 hour, and removing the solvent by 'evaporative deposition' in 5-10 minutes. Synthetic amyloid beta peptides are useful as research tools for studying neurotoxicity resulting from Abeta peptide -enhanced free-radical production. The treatment increases the activity of the synthetic Abeta peptides in test to determine free-radical generating capacity and glutamine synthetase
                                                                                 Sequence

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present invention relates to pharmaceutical compositions comprising complexes of heat shock proteins (haps) in association with antigenic molecules for use in treatment and prevention of neurodegenerative disorders and diseases. The complexes of hsp and antigenic peptides are used as vaccines for the treatment or prevention of neurodegenerative disorders e.g. Alzheimer's disease, age-related loss of cognitive function, senile dementia, parkinson's disease, amylotrophic lateral sclerosis, Wilson's disease, cerebral palsy, progressive supranuclear palsy, Guam disease, Lewy body dementia, prion diseases, spongiform encephalographics.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Heat shock protein and antigenic molecule complexes, useful for the prevention and treatment of neurodegenerative disorders e.g. senile dementia, Alzheimer's disease and epilepsy -

                                                                                           beta-amyloid precursor protein (APP). The peptide is used to create chimeric peptides of the invention. The chimeric peptides contain a N-CC chimeric peptides contain a N-CC chimeric peptides contain a N-CC creaminal peptide cleavage product of a precursor or mature protein, as a free N- or C-terminus, joined to a T cell epitope, with or without a spacer amino acid residue. Chimeric peptides comprising betaAPP peptides cleavage product the accumulation of amyloid beta peptide in the extracellular space, interstitial fluid and cerebrospinal fluid of the brain, and aggregation into senile amyloid deposits or plaques. They calso block the interaction of amyloid beta peptides with other molecules that contribute the neurotoxicity of amyloid beta. The chimeric peptides are useful for immunizing humans against the free N- or C-terminus of an internal self peptide; humans against the free N- or C-terminus of an errocursor protein or a mature product (e.g. APP peptide) derived from a precursor protein or a mature protein. The internal peptide cleavage product is the self molecule of the mammal.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Novel chimeric peptide containing N- or C-terminal end-specific B cell epitope from naturally occurring internal peptide cleavage product (such as beta amyloid peptide) of a precursor protein, joined to T cell

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The present invention describes a modified therapeutic peptide (I) comprising a therapeutically active amino acid region (III) and a creative group (II) (e.g. succinimidyl and maleimido groups) attached to calest therapeutically active amino acid region (IV), which covalently composed so the peptides of a second to form a composed of a second to form a competitive peptides of a second acids. (I) are useful for modifying therapeutic peptides e.g. hormones, growth cale factors and neurotransmitters, to protect them from peptidase activity in vivo for the treatment of various disorders. Endogenous therapeutic peptides are not suitable as drug candidates as they require frequent caministration due to rapid degradation by peptidess in the body. CC Modifying and attaching therapeutic peptides to albumin prevents or creduces the action of peptidases to increase length of activity (half cc life) and specificity as bonding to large molecules decreases. CC intracellular uptake and interference with physiological processes. CC AAB90829 to AAB92441 represent peptides which can be used in the cx and complete the present invention.
                                                                                                                                                                                                                                                                                                  Query Match
